

01 — HERO

vivus

A sofa shaped by the rhythm of the sea.

A sculptural sofa inspired by the flowing, clustered forms of sea anemones.

IMAGE

Use: Full three-quarter hero render of the sofa from page 6.

This should be the first major visual because it immediately communicates the form language.

02 — BRIEF

What happens when a marine form becomes furniture?

Tide explores a sofa concept derived from the visual characteristics of sea anemones—soft vertical growth, repetition, rounded edges, and dense organic rhythm—translated into a contemporary seating form.

IMAGE

Use: Sea-anemone reference image from page 2, followed by the sofa image.

Keep the two visually connected:

ANEMONE → SOFA

The PDF explicitly introduces the sofa through underwater-anemone inspiration.

03 — OVERVIEW

The inspiration isn't copied. It's translated.

Rather than reproducing the anemone literally, the project abstracts its most distinctive visual characteristics into the language of furniture.

Organic repetition becomes ribbing.
Soft rounded forms become upholstery.
Vertical growth becomes the backrest.

IMAGE

Use a **side-by-side comparison**:

Sea anemone detail → sofa form detail

This should be a clean visual translation study, not a moodboard.

04 — PRODUCT / SYSTEM

One continuous form, built from repeated ribs.

The sofa is organised around a timber base and a dense sequence of upholstered ribs that rise from the seat to form the back and arms.

The repeated elements create both the visual identity and the overall sculptural silhouette.

IMAGE

Use the **front-facing sofa render from page 3**.

This is the best image for clearly reading the repeated rib structure.

05 — WHAT DO WE KNOW?

The strongest visual characteristic was repetition.

Sea anemones create their distinctive appearance through many soft, rounded forms emerging together as a dense field. Tide translates that visual rhythm into a repeated upholstered structure rather than copying the organism directly.

IMAGE

Create one study sheet showing:

ANEMONE TENTACLES → RHYTHM → RIB PROFILE → SOFA

This should be a **form-analysis graphic**, not additional research text.

06 — INSIGHT

Repetition could become the identity of the sofa.

The repeated rib creates a continuous visual rhythm across the seat, back and arms, allowing the sofa to read as one sculptural object rather than a conventional frame with upholstery placed over it.

IMAGE

Use a **close crop of the rib transition** from seat → back → arm.

The page 5 render is particularly suitable because it clearly exposes the repeated upholstered structure.

07 — DESIGN RESPONSE

The rib became the building block.

The form was developed as a series of CNC-cut rib cores arranged along a rigid hardwood structure, then wrapped with high-resilience foam and upholstery to create the continuous upholstered surface.

IMAGE

Create an **exploded construction visual**:

HARDWOOD FRAME → RIB CORE → FOAM → UPHOLSTERY → FINAL SOFA

The supplied project describes this construction sequence and identifies the rib cores, foam, upholstery and walnut-finished base.

08 — FORM

Softness through repetition.

The sofa's character comes from the contrast between the rigid linear base and the soft, repeated ribs above it.

The ribs gradually change in height and direction around the perimeter, allowing the form to transition naturally from seat to back to arm.

IMAGE

Use the **front elevation and side/angled render together**.

The two images should clearly show how the rib profile changes around the sofa.

09 — FIT

The form wraps around the user.

The continuous rib structure establishes a contained seating zone, creating a clear boundary around the back and sides while maintaining an open front.

IMAGE

Use the **angled hero render from page 6** or create a simple seated-person visual showing:

BODY → SEAT → BACK → ARM

This section should communicate proportion and enclosure rather than manufacturing.

10 — FUNCTION

A sculptural form still has to behave like a sofa.

The internal structure supports a thick HR-foam seating block, while the individual ribs are padded with high-resilience foam to maintain the softness and rounded character of the exterior.

The material construction is intended to preserve the continuous upholstered appearance without losing the basic requirements of seating.

IMAGE

Use a **cutaway/exploded construction illustration** showing:

FRAME + FOAM + UPHOLSTERY

This is more useful here than another beauty render.

12 — DESIGN LANGUAGE

Organic. Repetitive. Sculptural.

The visual language is built from three recurring characteristics:

ROUNDED

Soft profiles replace hard transitions.

REPETITIVE

Individual ribs create one continuous visual rhythm.

ORGANIC

The silhouette grows and changes gradually rather than following a rigid geometric envelope.

IMAGE

Use a simple visual strip:

ANEMONE FORM → RIB → CURVE → SOFA

13 — DETAIL STUDIES

The form is carried all the way to the smallest element.

Each upholstered rib repeats the same rounded profile, while its position and height change across the sofa to create the larger organic silhouette.

The walnut base provides a contrasting horizontal datum beneath the soft upholstered volume.

IMAGE

Use close-ups of:

RIB PROFILE

RIB-TO-SEAT TRANSITION

UPHOLSTERY TEXTURE

WALNUT BASE

Page 5 already contains the strongest material and construction callouts for this section.

14 — USER / PROTOTYPE EVIDENCE

Designed to be experienced as a complete piece of furniture.

The final studies place the sofa in a realistic interior context to evaluate its relationship with surrounding furniture, scale and space.

IMAGE

Use the **living-room render from page 8**.

Important

Your supplied PDF does **not** document physical prototyping or user testing, so I would not claim either in the case study.

15 — BEAUTY SHOTS

TIDE

At this point, stop explaining.

IMAGE 01

Front view — page 3.

IMAGE 02

Three-quarter view — page 6.

IMAGE 03

Top/angled view — page 7.

IMAGE 04

Interior context — page 8.

The beauty-shot section should have almost no copy.
