

INTERNSHIP — OiMake

01 — HERO

DESIGNING THROUGH MAKING.

Five months designing DIY STEAM toys at **OiMake**, exploring how children learn through building, experimenting and using what they make.

Toy Design · STEAM · Product Development

Jan–May 2026 · OiMake

IMAGE

Full-width image of you / children using the products.

02 — CONTEXT

From classroom project to commercial product.

I worked within OiMake's product team across the full development cycle—from research and concept development to prototyping, testing and production. The products were developed for the commercial market rather than as academic exercises.

IMAGE

A simple **product pipeline**:

RESEARCH → DESIGN → PROTOTYPE → TEST → PRODUCE → SELL

03 — THE DESIGN SPACE

Learning happens when children make something themselves.

OiMake develops hands-on STEAM kits that combine physical making with science, technology, engineering, art and mathematics. The focus is on creating something tangible that children can build, keep and use.

IMAGE

Show a **collage of the four products**.

04 — WHO I WAS DESIGNING FOR

The child uses it. The parent buys it.

The design had to satisfy two perspectives at once: children needed an experience that was intuitive, engaging and hands-on, while parents needed clear learning value and accessible pricing.

IMAGE

Child using product + parent evaluating/purchasing

05 — WHAT I OBSERVED

Children touch first. Instructions come later.

Workshop observation showed that children naturally explore unfamiliar objects through touching, rotating, testing and attempting to take them apart. When multiple children used the same kit, making also became social—leading to comparison, experimentation and negotiation.

IMAGE

Your strongest **real workshop photographs**, preferably a sequence showing children discovering, building and comparing.

06 — HOW THIS SHAPED THE PRODUCTS

Make the learning visible.

Across the projects, the design challenge became balancing **play, learning, accessibility and the physical act of making** without turning the experience into a complicated science lesson.

IMAGE

A single **four-product matrix** showing what each product teaches / enables.

07 — FROM IDEA TO OBJECT

Every concept had to survive contact with reality.

Ideas were developed through sketches, form exploration, material decisions, electronics integration and working prototypes before being refined toward manufacturable products.

IMAGE

A horizontal process strip:

SKETCHES → MOCK-UP → PROTOTYPE → PRODUCT

Use process images from all four products together.

08 — TESTING

Build it. Watch it. Change it.

Prototypes were used to resolve interaction, construction and technical details before production. Testing included physical behaviour, assembly, component placement, lighting and usability. For example, the LED product went through switch and light-diffusion trials before the final configuration was selected.

IMAGE

A **testing/contact-sheet** with 4–6 small experiments rather than one large image.

09 — MAKING IT COMMERCIAL

The product had to work beyond the prototype.

The designs were considered alongside BOM cost, packaging, production, assembly and target pricing. The internship therefore extended beyond product design into the realities of getting a product ready for market.

IMAGE

Use:

BOM → packaging → assembled kit → final product

10 — THE WORK

Four products. One continuous learning loop.

Across the internship, I worked through different product challenges—from integrating electronics into a wearable bag to developing a low-cost interactive magnet and exploring a modular five-in-one STEAM platform.
